no. 6. Determination of thallium

SOURCE: Zhurnal analiticheskoy khimii, v. 20, no. 12, 1965, 1306-1311

TOPIC TAGS: polarographic analysis, thallium

ABSTRACT: Experiments were carried out in a recording polarograph of the "Orion" type (Hungary) and in an oscillographic polarograph type PO-02. The working electrode was a disk type graphite electrode with an area of 0.02 cm^2 , and the reference electrode was a saturated calomel electrode. An ammonium buffering solution was used as a polarographic background. All the solutions were prepared by double distillation. Based on the experimental results, a figure shows the polarization curves for the oxidation of Tl(I) ions and the reduction of the

Card 1/2

corresponding hydroxide in a 0.5 M solution of $(\text{NH}_4)_2\text{SO}_4 + \text{NH}_4\text{OH}$ (pH 9). A second curve shows the effect of an increase in the pH value. The method proposed was used for the determination of small amounts of thallium. The basic characteristic of the method is the anode oxidation of the Tl(I) ions in an alkaline solution up to the hydroxide Tl(III) on an electrode, with subsequent recording of the electrodissolution current for this compound. A study was made of the effect of the composition of the solution, that of the potential, and the duration of the electrolysis on the concentration of Tl(I) ions, and of the rate of change of the voltage on the cathode polarization curves for the electrodissolution of the hydroxide Tl(III). Orig. art. has: 6 figures and 1 table.

EXCERPTA MEDICA Sec 11 Vol.11/6 O.R.L. June 58

1039. EXPERIMENTAL USE OF GORDEEV'S LIQUID IN TREATMENT OF POLYPOID GRANULOMATA IN CHRONIC PURULENT MESO-AND EPITYMPANITIS (Russian text) - Brajrina P. Ya. - Sec. Med. Inst., Moscow - SBORN. TRUD. KLIN. BOLEZ. UKHA. GORLATI NOSA TBILISSK. MED. INST. 1957, 1 (125-136)

Amongst 45 patients, 9-62 yr. old, suffering from the polyloid granular form of chronic purulent otitis media, use was made of Gordeev's liquid No. 2 in the form of repeated applications and lubrications; in some cases this preparation was injected with an ordinary syringe. In many cases a combination of the methods was used. Amongst 13 patients suffering from large polypi obstructing the auditory meatus, a clinical cure was obtained in 8 cases and considerable improvement in 2 cases by removal of the polypi in conjunction with the application of Gordeev's liquid. In 13 analogous cases Gordeev's liquid was injected into the polyloid tissue, which resulted in a rapid clinical cure in 5 patients, considerable improvement in 5 cases, but no favourable results in 3. The injection of Gordeev's liquid into the polyloid tissue provoked in all cases intensive destruction of the tissue, rapid necrosis and disintegration and complete separation of the polypi on the 2nd to 3rd day. In 13 patients the chronic process in the middle ear was associated with the presence of small polypi and granulations and Gordeev's liquid was used in the form of lubrications and applications, resulting in a clinical cure in 7 cases and in considerable improvement in 2 cases. Signs of labyrinthism were observed in 2 cases following injection of the liquid.

DIPHTHERIA

"Experience in the Work of the Wards for Patients Suspected of Diphtheria", by S.L. Shapiro, L.G.. Badiryan and R.A. Braynina, Voprosy Okhrany Materinstva i Detstva, No 4, July-August 1957, pp 71-75

The relatively great frequency of a typical forms of certain infectious diseases has put the diagnostic wards in hospitals into practice. Immediately after the establishment of Offices for Gastro-intestinal Diseases, the wards for patients suspected of diphtheria began to develop. Such wards, for example, which were organized in Leningrad four years ago, have prevented a large number of patients to be subjected to the unnecessary introduction of serum, and have reduced the period of their confinement to bed three times, warding off the "hyperdiagnostics" of diphtheria during an epidemic.

A group of Moscow physicians, that studied the methods of fighting diphtheria in Leningrad, has carried it into Moscow, and here during the severe diphtheritic epidemic of May-June, 1955, the diagnostic wards were established. The experience of the diagnostic ward of the

Card 1/2

DIPHTHERIA

Children's Municipal Clinical Hospital No 2 imeni Rusakov in Moscow has shown that among the suspects for diphtheria, the diagnosis was only confirmed in 42 percent of the substantial cases. These data as well as a "series of other substantial material" have compelled the authors to acknowledge that "in the created epidemiological situation, the existence of the diagnostic wards is not only expedient but rather indispensable.

The authors conclude that the diphtheritic diagnostical wards have promoted the following aims. Earlier hospitalization of those who suffer from diphtheria, especially from serious forms; guarding patients free from diphtheria from being placed in the diphtheritic wards, and, consequently, keeping these wards from overcrowding; an abrupt decrease in the frequency of introducing anti-diphtheritic serum into children who are not in need of it; and finally decrease in the frequently unestablished diagnosis of diphtheria.

Title : Heating of Concrete Fill in Winter Time.

Orig Pub: Novaya tekhn. i peredov. opyt v str-ve, 1956, No 10, 5-8.

Abstract: Basing on the experience of the Kuibyshev "Gidroenergostroy" (trust for construction of hydraulic power stations) and of many Moscow constructions, it is recommended to heat the fill while it is in piles and to take the heated material from the bottom zone, as well as to heat the fill in drying barrels. It is shown that the method of heating the fill with steam in special bins, persisting at concrete factories, is little efficient and uneconomical. Tables characterizing the bin type heating installations, as well as engineering schemes of fill heating installations are attached.

*A quantitative active method for the serodiagnosis of syphilis. (Russian text) VESTN.
VENER. DERM. 1953, 3 (34-40) Tables 3

The method is based on the use of serial dilutions of sheep erythrocyte suspensions. The standard suspensions are prepared from defibrinated blood by haemoglobin estimations. Dilutions up to 1:800,000 are employed. The determination of the haemolytic index of the sera is performed at the same time as the test proper by introducing a corresponding number of control tubes without antigen. The sera are not inactivated and the tests can be performed within 5 min. after collection of the blood. The test is claimed to be highly specific and time-saving. Full details are given in the paper.

"The treatment of acute cholecystitis (Russian text) VESTN
KHIR. 1955, 4 (50-56)

Forty-three patients, operated upon for acute cholecystitis, were kept under observation, amongst them 18 with the first attack and 25 with recurrent attacks. Cholecystectomy was performed in 41 cases; 5 patients died, 3 from peritonitis. It is emphasized that an immediate operation is indicated in cases of acute cholecystitis, in which the progressive character of the disease is established. The gall-bladders, bile ducts and vessels were studied after having been filled with a staining substance. In the loose cellular connective tissue in the bed of the gallbladder the author encountered a series of superficially arranged bile ducts, 1-3 mm. in diameter, in direct contact with the gallbladder wall for a distance of 1-2 cm., but without communication with the gallbladder cavity itself. This result shows that on removing the gallbladder, an injury may be inflicted upon the superficially arranged

AUTHOR: Braytsev, V.M., Engineer SOV/98-59-1-3/14

TITLE: The Metallic Delivery Conduits of the Severnyy Donets -
Donbass Canal (Napornyye metallichесkiye truboprovody
kanala Severnyy Donets-Donbass)

PERIODICAL: Gidrotekhnicheskoye stroitel'stvo, 1959, Nr 3, pp 16-19
(USSR)

ABSTRACT: The author describes the project of metallic delivery conduits to be installed at the pumping stations and siphons of the Severnyy Donets - Donbass Canal. These conduits, 2,2 - 2,8 m in diameter, will have a total length of 18 km; 14,42 km of this will be disposed in two lines. Special devices could cut the waterflow in one and switch it to the other line, while repairs were executed in case of necessity. All conduits will be disposed in open air on especially-built supports. The project was elaborated by the Gidroproyekt MES (the Gidroproyekt of the Ministry of Electric Power Plants). As these delivery conduits must pass over unstable grounds, the Institut Gornogo dela AN SSSR (The Institute of Mining Engineering of the AS USSR) collaborated in the elaboration of the project by calcula-

Card 1/2

SOV/98-59-1-3/14

The Metallic Delivery Conduits of the Severnyy Donets - Donbass Canal

ting all the deformations of the ground up to the year 1987. The conduits are to be placed on intermediate (every 4.5 m) and anchor (every 120-128 m) supports. These anchor supports and special telescopic compensators mounted on each 128 m long sector of the conduit near one of the anchor supports are so calculated that every sagging or shifting of the ground is compensated by the move of the conduit in the telescopic compensator and by the sliding of the support on the supporting plate. The length of the conduit passing over the ground in zones of coal mines, where saggings are to be expected, is limited to 2,400 m. The method of compensation for the delivery conduit is described in detail. There are six diagrams and one photo.

AUTHOR: Braytsev, V.M., Engineer

TITLE: An Arched Overpass of the Metallic Pipeline of the
Severnyy Donets - Donbass Canal Across the Railway

PERIODICAL: Gidrotekhnicheskoye stroitel'stvo, 1959, Nr 6,
pp 19-21 (USSR)

ABSTRACT: The author describes the construction of an arched overpass for a metallic pressure pipeline of the Severnyy Donets - Donbass Canal across a double-track RR line of the Donbass railroad. It was impossible to place the pipeline under the railway line because of unstable terrain. The arch was the most economical solution of the problem. The arch is 42 m long and has a maximum height of 12 m. Both ends consist of monolithic concrete blocks as shown in Figure 1. The arch is composed of nine 4 m long sections and of 2 connecting sections, one for each concrete suppcrt. On the map, the arch divides the pressure pipe-line into two sections: one, about 1,500 m long; from

Card 1/3

SOV/98-59-6-5/20

An Arched Overpass of the Metallic Pipeline of the Severnyy Donets
- Donbass Canal Across the Railway

the pumping station to the arch and the second, 5,200 m long, from the arch to the water reservoir. The difference in heights between the axis of the arch and that of the water reservoir is 4 m. Under normal hydraulic conditions the piezometric pressure line passes below the axis of the arch. The upper part of the arch works on the siphon principle. In case of an accident in the first part of the pipeline section, the water from the 6,700 m long pipeline will be spilled under 80 m of static pressure. For preventing a spilling of 21,600 cu m of water from the second part, special safety valves are installed in the upper part of the arch. By opening them, the siphon action is interrupted by the release of air into the pipeline. The vacuum pumps are installed in one of the monoliths. The assembly of the arch was
